LingJian · Quick Start

Import, edit, export, download. Four steps to your video.

http://127.0.0.1:5000
Open the website and sign in. No installation needed. Ask your administrator for an account.

01 Import footage

Click Import or drag videos into the media library. Keep each upload batch under 50 MB in total. Start with 2 or 3 short clips.

02 Shape your story

Click + beside a video to add it to the timeline. Select a clip, set its in/out points and caption, then click Apply changes. Drag clips to reorder and choose your aspect ratio.

03 Let AI help (optional)

Open AI Director. Choose clips, a target duration and an editing brief, then Generate Plan. Review it and click Apply to Timeline. This replaces existing clips; you can still refine them.

04 Export and download

Click Save, then Export. When ready, download the MP4. Captions and transitions appear in the exported video; the player previews only the original footage.

For GPT: an administrator opens Accounts > AI Service, enters the service URL, key and models, tests, then saves settings. Choose Cloud analysis and confirm uploads and API charges. Local analysis runs on the website server without GPT.

Where is your data stored?

Your computer	Original footage and downloaded MP4 files.
Website server	Uploads, project, accounts, AI settings and exports awaiting download.
GitHub	Website code and guides, not your uploaded footage.

The free server loses temporary data, including accounts and uploads, when it sleeps, restarts or redeploys. Save writes only to the server. Keep your originals and download finished videos promptly.

Working as a team: All accounts share one project and media library. Edit one person at a time; save before handing over, then let the next person refresh.
